

1 DR. MATSUMURA: I think it is a separate  
2 question of what should we recommend for abdominal  
3 films in clinical care of patients, and in response  
4 to the question of why there are few abdominal  
5 films, I think many clinicians will look at the  
6 data and say you have identified two fractures by  
7 films, 0.4 percent in the pivotal study; no  
8 clinical consequences. And, I think they may  
9 regard an abdominal film as perhaps something they  
10 will get as a baseline in case something happens,  
11 but not to be doing it with as frequent intervals  
12 or same intensity as we were doing in this research  
13 study where we want to capture anything that might  
14 happen in these rare events.

15 DR. PINA: You are not planning on  
16 including that?

17 DR. MATSUMURA: Do you want to address the  
18 labeling?

19 MR. WILLIAMS: We will share, as part of  
20 the physician training and labeling, what the  
21 clinical experience has been and the obvious  
22 benefits of rigorous follow-up. What is actually  
23 clinically applied and clinically practical, as Dr.  
24 Matsumura refers to, really does come down to  
25 physician judgment, but I think it would be the

1 responsible thing for the sponsor to share the  
2 advantages of the clinical research learning and  
3 that has provided us with a higher level of  
4 rigorous follow-up.

5 DR. PINA: I have no further questions.

6 DR. MATSUMURA: I know you want the break,  
7 but to go back to your impression on the Atlanta  
8 case, I do remember this very clearly because I had  
9 a phone conversation about this. The PI was called  
10 because the CT scan had this impression of lumen  
11 thrombus within the graft; ran down to look at the  
12 film; ran up to see the patient; and it was the  
13 PI's impression that none of the symptoms that the  
14 patient had were attributable to the intraluminal  
15 thrombus. There were pulses in the feet. The  
16 patient didn't have symptoms referable to limb  
17 occlusion. So, I think it was that clinician's  
18 impression that those symptoms were not referable  
19 to that luminal thrombus.

20 DR. PINA: Well, they didn't actually  
21 sound like rejection but here is one where you  
22 should have a normal heart. I am using that as an  
23 example of somebody if you have a transplant,  
24 supposedly if they are not rejecting it their heart  
25 is still functionally normal, which is different

1 than your other population which has pretty sick  
2 hearts, it sounds like.

3 DR. LASKEY: Is that it? We are late in  
4 the fifth set and we have a lot of work to do here.  
5 There is some important discussion. So, I would  
6 suggest we make a ten-minute break please, and if  
7 we can all convene at 4:20 we can get onto the  
8 panel recommendations.

9 [Brief recess]

10 DR. LASKEY: Thank you for your  
11 promptness. At this point, we would like to hear  
12 the questions again so the panel can go through the  
13 process here. I am going to relieve our very  
14 responsive people at the table. If you all could,  
15 please step back from the table now; take a break.  
16 We would like to have the questions posed to the  
17 panel.

18 If I might, I would like to summarize  
19 where we are on each of the points put to us, and  
20 to try to summarize consensus and dissent. With  
21 respect to the first question, the primary safety  
22 endpoint was the rate of major complications by 12  
23 months. The data are presented for individual  
24 adverse events. Analyses are provided for risk  
25 factors. Summary of the 24-month results is also

1 included. Please comment on whether the results of  
2 the clinical study provide reasonable assurance of  
3 safety in the intended population.

4 At the outset, I have to say that I don't  
5 know who the intended population is. It was never  
6 clear to me, as I believe Dr. Roberts was getting  
7 at and a number of other people were getting at.  
8 How many people are in the box at the very top of  
9 this schematic diagram? Before you get to the  
10 decision point as to whether they go into the  
11 control arm or the EBE arm, really how many  
12 patients were in the box before that that then led  
13 to this decision path?

14 Furthermore, it was always clear to me  
15 that everyone needed to be a surgical candidate,  
16 and that needs to be reflected in our thinking.

17 Members of the panel, is it fair to say  
18 that based on what we have heard today with respect  
19 to the safety endpoint the sponsor has met the goal  
20 of demonstrating safety? It certainly appears from  
21 the K-M curves, if that is the primary endpoint  
22 analysis, as well as the cumulative event rates  
23 that the adverse event rate was certainly  
24 significantly higher in the surgical control arm  
25 than in the EBE arm. So, do we have consensus on

1 that point? I think so. Good.

2           Number two, primary effectiveness--I can't  
3 strictly say efficacy because it is not a  
4 randomized trial, but primary effectiveness  
5 endpoint of the clinical study was exclusion of the  
6 infrarenal abdominal aortic aneurysm from the blood  
7 circulation, defined by absence of aneurysm  
8 enlargement and endoleaks, as evaluated through 12  
9 months. Additionally, data regarding potential  
10 problems associated with endovascular treatment are  
11 presented. A summary of 24-month results is also  
12 included. Please comment on whether the results of  
13 the clinical study provide reasonable assurance of  
14 effectiveness in the intended population.

15           Again, I think we need to be very clear  
16 about the intended population, that every single  
17 one needed to be a surgical candidate. Secondly, I  
18 took away a significant amount of concern, if not  
19 dissent, that the primary effectiveness endpoint  
20 was not met to the level of statistical rigor  
21 defined prospectively, as discussed by Dr. White,  
22 Dr. Grey and others. That is from a statistical  
23 standpoint. From the clinical standpoint, is the  
24 80 percent efficacy satisfactory to the panel?  
25 And, are we happy with the disparity in the unit of

1 analysis that went into the derivation of that  
2 number? I think not but can we have some  
3 discussion?

4 DR. COMEROTA: I will kick off the  
5 discussion at some risk. I think it is fair to say  
6 objectively there are not statistical results which  
7 would support efficacy. That has been decided on  
8 the basis of the sponsor's identification of what  
9 their endpoint was to be at the beginning of the  
10 trial, which was a rather high bar to set. If we  
11 look at were the efficacy endpoints reasonable and  
12 clinically meaningful, I think the answer would be  
13 yes. Dr. White pointed out discrepancies in ways  
14 of evaluating the numbers of patients at 12 months  
15 by the core lab versus the investigators. The  
16 absolute numbers are reduced by the core lab  
17 report. The percentage, however, reporting  
18 endoleaks does not change.

19 So, if we can assume that that is a  
20 reasonable look at the overall test group, then  
21 efficacy still does not reach statistical power.  
22 But from a clinically meaningful perspective, it  
23 probably does.

24 DR. BAILEY: Could I just bring up one  
25 question that I may have asked but I am now

1 confused again? Dr. White has educated me on how  
2 confused I should have been about the denominators,  
3 but I would like to inquire once more about the  
4 numerator for that efficacy. I am sorry that the  
5 company has had to step back, but if a patient had  
6 an endoleak at six months and it was treated, and  
7 they also came in at 12 months and it was seen to  
8 be negative with no endoleak at 12 months, are they  
9 in the numerator or not?

10 DR. COMEROTA: I don't think so. The  
11 answer to that would be no.

12 DR. BAILEY: In other words, efficacy then  
13 from that point of view is defined as no endoleak  
14 that cannot be treated within the first 12 months;  
15 that it is absent at 12 months?

16 DR. COMEROTA: An endoleak is absent at 12  
17 months.

18 DR. BAILEY: Yes, but it may have to be  
19 treated in the interim.

20 DR. COMEROTA: If it was treated at six  
21 months and it is no longer present at 12 months, it  
22 is absent at 12 months.

23 DR. BAILEY: Right, and that is the  
24 definition of efficacy that we are dealing with.

25 DR. LASKEY: I suppose we can go back to

1 the panel pack and see how efficacy is defined.  
2 Was it a time to event or was it a cumulative  
3 event? In which case, I guess there is censoring  
4 involved.

5 DR. BAILEY: I am okay with that  
6 definition. It just needs to be up front that  
7 efficacy is not absence of ever having a leak; it  
8 is that you may have a leak but if you can treat it  
9 and it is gone at 12 months, then that is  
10 considered a success.

11 DR. COMEROTA: Or if it is identified, not  
12 treated and gone.

13 DR. BAILEY: Or if it is identified, not  
14 treated and gone, that is a success.

15 DR. LASKEY: Further discussions on  
16 efficacy? I am not sure we are going to, nor  
17 should we get around this issue of statistical  
18 versus clinical significance. I think people will  
19 vote with their feet on that one.

20 DR. WHITE: Let me just respond to Tony,  
21 and that is that not only did they not make the  
22 statistical efficacy but, more so, the lack of  
23 evaluation of 30 percent of the patients for at  
24 least one of the endpoints, the endoleak business,  
25 means that there is an underestimation even of the

1 numerator and we know the minimum number of  
2 patients.

3 We also know, as I believe Dr. Freischlag  
4 pointed out or maybe it was Dr. Najarian, that in  
5 the second year there are actually more of these  
6 appearing and worsening of the size of the  
7 aneurysm, more enlargements. It seems to be  
8 progressive over the second year. So, when we ask  
9 ourselves is it clinically important that they meet  
10 the 80 percent arbitrary number, I find the fact  
11 that they failed in that regard to be very  
12 significant and I would not, as Tony is suggesting,  
13 dismiss the importance of the statistical efficacy.  
14 I think we are missing a big chunk of these  
15 patients and we could be surprised with some really  
16 bad numbers if we knew the whole numbers.

17 DR. LASKEY: In fact, the point estimate  
18 might be well below 80 percent.

19 DR. WHITE: Right.

20 DR. LASKEY: Third question--

21 DR. ZUCKERMAN: Dr. Laskey, this point  
22 about what the panel believes about clinical versus  
23 statistical efficacy is an important one for any  
24 approval decision, etc. So, is it possible to hear  
25 from other panel members on this point?

1 DR. PERLER: Well, I have a question. Is  
2 historical precedent of relevance here in terms of  
3 other devices and where the threshold was set in  
4 terms of clinical and statistical efficacy? If  
5 that is an inappropriate question, I withdraw it.  
6 If it isn't inappropriate, what was that threshold?

7 DR. ZUCKERMAN: Each PMA should stand on  
8 its own. I think why we are at a panel meeting  
9 here is that it is obvious that the primary  
10 endpoint was not met from a statistical basis, but  
11 there is a wide amount of historical literature now  
12 available. So, you are asked as panel experts to  
13 comment on the observed results with their  
14 confidence intervals and make a guesstimate as to  
15 what you think of it.

16 DR. LASKEY: Warren, can I ask you a  
17 question?

18 DR. LASKEY: Yes?

19 DR. AZIZ: This is the 40 patients in whom  
20 the CT scan could not be interpreted for endoleaks.  
21 It may have been at six months or a year. I don't  
22 mean to sort of cloud the argument, but could those  
23 40 patients--could we ask them to, in the near  
24 future, repeat the CT scans or would that muddy the  
25 water? I mean, it is not like it can't be done.

1 DR. LASKEY: Well, it is certainly off  
2 protocol to do it at this point. I guess, from my  
3 standpoint where the rubber meets the road here,  
4 the decision that we have to make is based on the  
5 adequacy of the primary data. If we do not have an  
6 adequate number of evaluable patients, and 80  
7 percent is usually the magic number in our business  
8 for restenosis studies for example, if you don't  
9 have an evaluable number of patients, then the  
10 point estimate you come up with is highly  
11 uncertain. And, I think that is what we are  
12 struggling with here. The core lab study number is  
13 not adequate for our standards to make a meaningful  
14 decision. That I think is at the heart of it. So,  
15 doing the studies at this point I don't think would  
16 be terribly helpful. Is the agency satisfied with  
17 that deliberation of statistical versus clinical?  
18 We need an adequate database to make an informed  
19 decision.

20 DR. ZUCKERMAN: Right. What I would like  
21 to know, from the agency's viewpoint, is whether  
22 that is the consensus opinion of the panel for  
23 answering this question, or is there a significant  
24 amount of division.

25 DR. FREISCHLAG: I guess what I am

1 wrestling with is I wouldn't have a problem if they  
2 were close if we had all the data. I guess that is  
3 everybody else's point. If we had every single  
4 piece of data and they missed it by a little, then  
5 I guess I would go into the biological versus the  
6 statistical and feel pretty comfortable that I was  
7 all right with it. I must admit, I thought I  
8 wasn't confused until we kept talking, and I think  
9 there is a confusion about how many scans and all  
10 that, and that is what has gotten me befuddled as  
11 we kept counting. If we added all of them and it  
12 was close I would feel much more comfortable sort  
13 of saying you are close. I am real uncomfortable  
14 with missing data.

15 DR. LASKEY: I think it is fair to say we  
16 all are.

DR. ZUCKERMAN: Okay.

17 DR. LASKEY: And, that that precludes a  
18 definitive decision on the clinicians' part.

19 DR. ROBERTS: I guess I would say that I  
20 would sort of echo what Dr. Freischlag just said,  
21 which is I would be much less concerned I guess if  
22 I knew that they just--you know, obviously you set  
23 these numbers up ahead of time. You are going sort  
24 of a priori; you are not really sure probably  
25 exactly what you ought to be aiming at. So, I

1 wouldn't really be too concerned statistically  
2 about this. I think clinically, my concern just  
3 rests in terms of do we really know what happens  
4 with these patients, and if we are missing some of  
5 the data points then, you know, we have to be  
6 concerned about is this really something that is  
7 going to be effective.

8           On the other hand, to some degree, you  
9 know, there are devices out there, both for this  
10 application and other types of applications, where  
11 part of the clinical use of these isn't 100  
12 percent. You don't, for sure, know what all the  
13 data is. I think this is where I get really  
14 concerned in terms of the labeling and in terms of  
15 the education of both the clinicians and the  
16 patients to understand that, you know, the science  
17 only gets us so far and we really don't have the  
18 long-term data. Even if we had all the data points  
19 for this two-year study, we still don't really know  
20 what is going to happen in year three and year four  
21 and year five. So, to some degree, I think we have  
22 to understand that we are dealing with some  
23 uncertainty here even with all the data.

24           DR. LASKEY: That is true, Anne, but those  
25 are very different issues than deciding on a

1 12-month endpoint which doesn't have an adequate  
2 number of patients at that endpoint.

3 DR. ROBERTS: That is still the reality.

4 DR. LASKEY: Yes. Again, Dr. Zuckerman, I  
5 am not sure we are going to demonstrate consensus  
6 at this point in time. That may be reflected in  
7 the way people vote but it is obviously a  
8 fundamental issue. Can we move on?

9 DR. ZUCKERMAN: Yes.

10 DR. LASKEY: The third question, please.  
11 Core laboratory has reported two cases of wire  
12 fractures, one identified at discharge from the  
13 pivotal clinical study and the other at 12 months  
14 in a patient enrolled in the second generation  
15 device study. There were no adverse events  
16 associated with either report, but there is no  
17 conclusive evidence to verify the presence or  
18 absence of the fractures. Both reported fractures  
19 were identified in the main body of the graft, not  
20 in a seal zone or point of attachment to the aorta.

21 DR. PINA: Warren, I would like to ask  
22 some of my vascular surgeon colleagues how  
23 comfortable they are with this because I know that  
24 is something that would trouble me.

25 DR. LASKEY: Let me finish. You are

1 right, this will come right out of this  
2 continuation. After the packs were sent to the  
3 panel, the sponsor reported an additional wire  
4 fracture which was recently identified during  
5 analysis of a device explanted in Germany. Details  
6 concerning the length of the implantation, etc.,  
7 etc. remain unavailable. Based on the sponsor's  
8 analysis it appears that the fracture, which was  
9 also located in the main body of the graft in the  
10 crotch of the bifurcation, did not result in any  
11 clinical complications. Please comment on the  
12 significance of these observations.

13 DR. PINA: Again, I would like to ask my  
14 vascular colleagues, maybe Tony or Dr. Aziz, what  
15 they feel about the fracture issue since I am not a  
16 surgeon.

17 DR. COMEROTA: Warren, you are looking at  
18 me.

19 DR. LASKEY: No, actually I was watching  
20 the interchange. The question was put to Dr. Aziz  
21 and --

22 DR. COMEROTA: He patted me on the back.

23 DR. LASKEY: Yes.

24 DR. AZIZ: I do mainly cardiac surgery. I  
25 am not really an expert to make a real comment on

1 that. But it would really depend on what effect  
2 does a fracture have on, let's say, what the device  
3 is trying to achieve, it seems to me. I mean, if  
4 you had a fracture and it didn't have an effect on  
5 the aneurysm enlarging or rupturing or endoleaks,  
6 then I think it may be sort of a true unrelated  
7 phenomenon. But if it fractured and it meant that  
8 the device was malfunctioning, then I think to me  
9 it would seem that that would be an important  
10 factor.

11 DR. COMEROTA: The answer to the question  
12 is that I don't know that we know what the  
13 significance is, other than that it was not  
14 clinically significant up to the point that it was  
15 identified. I presume those patients will continue  
16 to be followed since it was an incidental  
17 observation as part of the follow-up phenomenon.

18 DR. PINA: What concerns me is that it  
19 sounds like the core lab identified it and the  
20 investigators did not. That goes back to my  
21 question, what is the best way for the clinician,  
22 once they insert these, to look for things like  
23 fracture. I mean, I am comfortable with the fact  
24 that they were in the body and not in the junction  
25 points.

1 DR. COMEROTA: Of course, there are some  
2 endografts that have no external support in the  
3 body of the graft; it is only at attachment points.  
4 So, again, the relevance of that observation I  
5 think we don't know yet.

6 DR. NAJARIAN: I think you would have to  
7 look at the clinical sequelae. I mean, if every  
8 single one that was implanted had a fracture in it  
9 but, yet, there were no clinical problems I would  
10 still have no problem with it because devices we  
11 put in all the time and sometimes they do break;  
12 catheters crack but there really is no clinical  
13 problem with that. It sounds awful. I believe the  
14 metal is just used to support the graft and, just  
15 looking at it, I can't imagine that one fracture  
16 would actually affect the integrity that much and,  
17 if it did, we would know or we would know in time.

18 DR. AZIZ: Wasn't there a stented graft  
19 that had fractures and was withdrawn from the  
20 market?

21 DR. ZUCKERMAN: You know, as previously  
22 mentioned, I think in an ideal world one would like  
23 to design a device such that there are no fractures  
24 and no concerns about clinical sequelae. As to  
25 whether in this case there is a different threshold

1 is the question before the panel. Could we  
2 consider an approval based on a device that doesn't  
3 have 100 percent device integrity without clinical  
4 sequelae? Yes, but we need to hear from the  
5 vascular surgical experts and interventional  
6 radiologists as to why that is okay. You know, Dr.  
7 Najarian gave some comments and so forth.

8 DR. PERLER: I think we could, but I think  
9 we must expect that there will be much more  
10 consistent KUB follow-up of this cohort through  
11 five years. I think the other issue, at the risk  
12 of opening a Pandora's box, is that probably CT is  
13 not as sensitive as plain old KUB for looking at  
14 this potential complication. That was another area  
15 where there was less data than with CTs, and  
16 certainly that would be something that would have  
17 to be done, if this is approved, for the five years  
18 to follow.

19 DR. ROBERTS: The only question I would  
20 ask, and maybe it is not known, but why was this  
21 one explanted? I mean, why did it come out? I  
22 mean, it is one thing to see it on a film and we  
23 know that that didn't seem to have, you know, any  
24 consequence in terms of how the patient did but I  
25 was just wondering if anybody knows why that one

1 was explanted.

2 DR. LASKEY: I think we would have to ask  
3 the sponsor why that happened.

4 DR. ROBERTS: Can they respond?

5 DR. LASKEY: Maybe the short way to do  
6 this is to have the sponsor respond in two  
7 sentences. Could you do that?

8 MR. WILLIAMS: Can they be long sentences?

9 DR. LASKEY: Yes, not run-on though.

10 MR. WILLIAMS: This particular device was  
11 explanted because the patient had a contained  
12 rupture and the patient had a surgical conversion.  
13 That is one sentence. My second sentence is that  
14 the sponsor would like to request some additional  
15 time to discuss the statistical issues, please.

16 DR. LASKEY: Okay, we will do that at the  
17 end of all of our questions. I know that doesn't  
18 answer the question.

19 DR. ROBERTS: No, it does answer it. I  
20 think the other two fractures, and obviously we  
21 don't know enough about this but the one thing I  
22 would say is the other two fractures apparently had  
23 no clinical sequelae. This, I am assuming, is a  
24 fracture that presumably did have clinical sequelae  
25 in that the patient had a contained rupture. So,

1 that is concerning.

2 We know this is going to happen. I  
3 certainly echo what everybody else says, that  
4 certainly we know that these things break in the  
5 body and it just goes back to the importance of  
6 follow-up not only for the study cohort but for the  
7 rest of it. I think it is very important to  
8 remember, and again what Dr. Perler said is true,  
9 that you can't follow these on CT. It is very hard  
10 to follow fracture of the metal within these  
11 because you are cutting across the same spot as the  
12 metal is and you maybe get it; maybe you don't.  
13 So, they really do need careful follow-up with KUBs  
14 to know whether it is fracturing. I think that  
15 will be certainly an important part to put in the  
16 labeling and the patient education and in the  
17 educational materials for clinicians who are going  
18 to be putting these in.

19 DR. WHITE: Could you comment on the  
20 ability to reconstruct the 3D CT? I have seen some  
21 beautiful reconstructions of aortas and it seems  
22 like that might be an excellent way to look at the  
23 footprint of the graft. Would that do it better  
24 than a KB?

25 DR. ROBERTS: It depends on how carefully

1 you do the reconstruction and whether you  
2 completely reconstruct the whole area; whether or  
3 not you have a lot of calcium in the way. You  
4 know, you may be able to do it but you may still  
5 miss it.

6 DR. LASKEY: To answer your question,  
7 there may be some clinical significance to these  
8 observations. We don't know. The event rate is  
9 small enough and the denominator large enough to  
10 make it difficult to make cause and effect, one to  
11 one, but we are concerned.

12 DR. ZUCKERMAN: And, Dr. Roberts, you may  
13 want to look at page 5-129 quickly regarding the  
14 German case.

15 DR. LASKEY: But to put this into,  
16 hopefully, some final perspective, these are three  
17 fractures identified over--what would be the  
18 denominator then? Not that we shouldn't be  
19 concerned about three fractures. What did you say  
20 the number of implants was that you might have a  
21 handle on? I know that they weren't routinely KB'd  
22 and routinely CT'd. If this were standard  
23 postmarketing surveillance, what is the number?

24 DR. MATSUMURA: There was one in the 235  
25 patients. Of the three worldwide, there were 4400

1 patients with over 10,000 implants.

2 DR. COMEROTA: What is the number of KUBs?  
3 That is the denominator.

4 DR. LASKEY: Right, the number that were  
5 KUB'd.

6 DR. MATSUMURA: The number of patients  
7 with KUB in the pivotal study at a given time point  
8 is in the panel pack, 70 percent. There were 229  
9 out of the 235 patients who had a KUB at any time  
10 point in the core lab.

11 DR. LASKEY: Thank you. For the fourth  
12 question then on the labeling, one aspect of the  
13 premarket evaluation of a new product is the review  
14 of its labeling. Labeling must indicate which  
15 patients are appropriate for treatment, identify  
16 potential adverse events with the use of the  
17 device, and explain how the product should be used  
18 to maximize clinical benefit and minimize adverse  
19 events.

20 Again, at the outset I think it should be  
21 stated clearly, and I don't think it is, that all  
22 the patients in the pivotal study needed to be  
23 surgical candidates, and that all the information  
24 derives therefrom.

25 In terms of whether there was panel

1 consensus on which patients are appropriate for  
2 treatment, we have had the anatomic criteria  
3 delineated. I am not sure we have had the clinical  
4 criteria delineated. And, I think we should have  
5 some additional discussion about potential adverse  
6 events with the device, including fracture, wire  
7 fracture, and how the product should be used to  
8 maximize clinical benefit. I certainly don't think  
9 at this point there is consensus on this issue.  
10 So, let's start with which patients is this  
11 appropriate for. Do we feel that there is enough  
12 information in the IFU right now, as is, to make  
13 that perfectly clear? Dr. Roberts?

14 DR. ROBERTS: Well, I think there is a  
15 fair amount of data. I think the issues that I  
16 would have would be standard ones in terms of  
17 having an aneurysm, obviously having a neck that is  
18 within the standards of the 1.5 cm, having suitable  
19 landing sites for the distal portion of the graft.  
20 The one thing that I think I would like to see  
21 strengthened is that I am a little bit concerned  
22 about the size of the iliac vessels.

23 DR. LASKEY: So, adding dimensional data  
24 with some reasonable degree of precision?

25 DR. ROBERTS: Yes, I think that would

1 probably be a good idea, or at least rather than  
2 just very vaguely spell out iliac morphology,  
3 instead to perhaps either, you know, give some kind  
4 of a size indication and also something about the  
5 morphology in terms of the calcification and the  
6 tortuosity of the vessels.

7 DR. LASKEY: I know we have heard from Dr.  
8 Aziz and others that likely to be the case is that  
9 this device will be pushed, the technique will be  
10 pushed, and that it is likely it will be tried in  
11 patients that are not included in this kind of  
12 trial. Does anyone share my concerns about  
13 insisting that the language read that the patients  
14 need to be surgical candidates? That is certainly  
15 the way the protocol reads. Do we want to carry  
16 that through the IFU?

17 DR. PERLER: Well, I think there are very  
18 high risk patients for open surgery for whom  
19 endoluminal grafting is a real benefit. I would  
20 have a problem with that wording.

21 DR. WHITE: I think though the reason that  
22 it is brought up--I wouldn't argue with you but I  
23 think we don't know the performance of the device  
24 in that population. My problem is whether or not I  
25 think there is efficacy data to say that this

1 device is equivalent to open surgery. I mean,  
2 basically we are being asked to say that the device  
3 qualifies as an alternative to an open surgical  
4 procedure in a patient who is a surgical candidate  
5 and I think there is a question about that.

6 DR. COMEROTA: I think the issue is a  
7 little bit different there, Chris. These are good  
8 risk patients that were evaluated in this trial so  
9 that they can be longitudinally followed over  
10 reasonably long periods of time.

11 DR. WHITE: Tony, they weren't good risks  
12 though because they were ASA all the way to Class  
13 IV.

14 DR. COMEROTA: Correct, but sharing  
15 Bruce's concern about modified wording, the patient  
16 that we would most like to have this available for,  
17 or any alternative to an operation available, is  
18 the patient that is not likely to live for two,  
19 three and four years but is at very high risk of  
20 rupturing their aneurysm in the immediate future  
21 and if you have an effective device that can be  
22 delivered safely, then that would be a good  
23 alternative to not operating.

24 DR. WHITE: But nothing that we are going  
25 to do today would stop you from using an approved

1 device in that individual patient.

2 DR. LASKEY: There is no question what you  
3 say is true, Tony, but we have no data before us to  
4 support that. That would be a different study.

5 Ileana?

6 DR. PINA: I am not sure that in the IFU  
7 packet there is a descriptor of the control group  
8 from the pivotal trial of who are more likely to be  
9 symptomatic, which is why they were taken into the  
10 surgical arm instead of getting the prosthesis, and  
11 I think that that needs to be stated there, that  
12 this population was largely not "symptomatic" if  
13 there is such a thing as symptoms. I agree with  
14 you on that, Dr. Freischlag.

15 DR. FREISCHLAG: I also think for use of  
16 this graft that you don't need to be a surgical  
17 candidate. I guess my concern is size. You know,  
18 it doesn't really even say you have to have an  
19 aneurysm in their labeling. You assume you are  
20 going to; that is why you are using it. But  
21 whether or not size needs to be suggested in the  
22 labeling too--I guess you could argue, you know,  
23 that a 3 cm aneurysm is an aneurysm but I think we  
24 have data with that, and I don't know the answer to  
25 that but I think I would be more concerned about

1 the size rather than the surgical candidate piece  
2 because that is what the physician is going to  
3 decide.

4 DR. ROBERTS: I, quite frankly, would  
5 disagree with this idea of saying that they have to  
6 be a surgical candidate. I honestly think that  
7 boxes people in and I don't think that is really a  
8 reasonable thing. I think it is what was done for  
9 the study, and I think it was an appropriate thing  
10 to do for the study because it allows for a control  
11 group but I don't think it ought to go on the  
12 labeling.

13 On top of that, quite frankly, I am much  
14 more worried about the patients who are surgical  
15 candidates and whether or not this is the right  
16 thing for them. You know, if you have a young  
17 50-year old who has an aneurysm, is this the right  
18 thing? And, that we don't have the answer to. But  
19 I don't think we ought to limit it to people who  
20 are surgical candidates.

21 DR. ZUCKERMAN: I think it is necessary to  
22 understand that when we are writing an indication  
23 statement for this PMA device, it is important that  
24 the indications statement reflects the clinical  
25 trial data because that is where we know the data

1 are. Now, several people have spoken about how  
2 this device might perhaps work superbly in other  
3 patient populations, but that is not the point  
4 under discussion today for the indications  
5 statement. We have a PMA clinical trial and we  
6 need to use those patients and data to write an  
7 indications statement.

8 DR. LASKEY: While I appreciate the  
9 discussion, I think the mission here is to adhere  
10 to the spirit of the protocol, and we cannot go  
11 beyond the lessons learned from this protocol, much  
12 as we would like to use these in patients who are  
13 critically ill and not surgical candidates.

14 DR. ROBERTS: But if I am reading what you  
15 say correctly, Bram, what you are saying is that  
16 the indication for use for the Excluder  
17 Endoprosthesis is intended to exclude the aneurysm  
18 from the blood circulation in patients diagnosed  
19 with infrarenal AAA disease who have appropriate  
20 anatomy. It says absolutely nothing about whether  
21 or not they are surgical candidates or not. If we  
22 are asked to comment on that, I would agree that  
23 that at least begins to define it although I would  
24 add that probably it wouldn't be a bad idea to put  
25 something in terms of how big the AAA is, and also

1 define the appropriate anatomy a little bit more to  
2 make sure that people understand that they have to  
3 worry about iliac arteries and that kind of thing.

4 DR. ZUCKERMAN: Yes, let me make some  
5 suggestions as to what we do in situations like  
6 this for other stents, such as our coronary stents.  
7 One is that we can make a better effort, as I have  
8 heard, to define the dimensional measurements of  
9 the vessels so that we know the patient population.  
10 Mr. Gantt is also going to show examples with other  
11 approved devices as to how we better specified the  
12 intended patient population. Sometimes we just  
13 describe in the clinical trial section a better  
14 description of what was studied and put in  
15 parenthesis in the indications statement "see  
16 clinical trial section." But, you know, we are  
17 here to try to better describe and indicate this  
18 device for what it was studied for today.

19 MR. GANTT: If I may, I can show you the  
20 other currently approved indications for use  
21 statements.

22 DR. LASKEY: I certainly think it is  
23 instructive but I don't think it should bear on our  
24 decision based on the data in front of us, but it  
25 is certainly very instructive. Thank you.

1 [Slide]

2 MR. GANTT: Another example refers to  
3 anatomic considerations, not clinical indications.  
4 Okay?

5 [Slide]

6 One final example.

7 DR. LASKEY: So there is some attempt to  
8 quantitate, or at least to provide dimensional  
9 data. That is helpful. That is very helpful. So,  
10 I should not be concerned about the fact that we  
11 are not going to use the language that they need to  
12 be surgical candidates even though that is the way  
13 this protocol was written.

14 DR. ZUCKERMAN: You can make that  
15 suggestion.

16 DR. LASKEY: Thank you. Have we achieved  
17 consensus on using the device to minimize adverse  
18 events? I think so.

19 Question 4(a), does the indication for  
20 use, as stated below, adequately define the patient  
21 population studied, and for which the device will  
22 be marketed?

23 The Excluder Endoprosthesis is intended to  
24 exclude the aneurysm from the blood circulation in  
25 patients diagnosed with infrarenal AAA disease who

1 have appropriate anatomy. I think here we can  
2 build on lessons learned and add some of the  
3 quantitative dimensional data. Agree?

4 Question 4(b), based on the clinical  
5 investigation experience, are there any additional  
6 warnings, precautions, or contraindications that  
7 you think should be included, either specific to  
8 this device or from a generic standpoint for  
9 endovascular grafts?

10 I will just lead off. Since we are on the  
11 theme of looking for fractures, I don't think we  
12 know the estimate of their frequency with any  
13 precision and I don't think we know their clinical  
14 significance. So, we need to continue to acquire  
15 data along those lines.

16 DR. PINA: Warren, I think that we should  
17 also add that endoleaks can happen early. This may  
18 be true in other grafts, as I have heard, and these  
19 may need to be repaired early; and some can appear  
20 even later, beyond the 12 months.

21 DR. LASKEY: Right, that this device  
22 confers the risk of endoleak and, therefore,  
23 additional intervention. Good.

24 DR. PERLER: I think there should be a  
25 statement that the safety of bilateral internal

1 iliac artery occlusion in the deployment of this  
2 device has not been established.

3 DR. LASKEY: Anything else?

4 DR. COMEROTA: Are you talking about this  
5 device specifically or the general concept of  
6 bilateral internal iliac artery occlusion, Bruce?

7 DR. PERLER: Both.

8 DR. LASKEY: The question is open-ended.

9 DR. PERLER: But in this study that was an  
10 exclusion criterion. Apparently none of the  
11 patients had bilateral hypergastric exclusions so I  
12 think that ought to be stated in the labeling.

13 DR. ROBERTS: I would go a little further  
14 than just the KUB and I would just say that KUB and  
15 CT scans need to be done on at least an annual  
16 basis, and I would like to actually see something  
17 in the labeling that says that we don't have  
18 long-term follow-up on these devices and careful  
19 follow-up of the patients is mandatory.

20 DR. COMEROTA: What about using an  
21 alternative imaging technique, other than CT, such  
22 as MRI may be substituted?

23 DR. ROBERTS: Yes, I was looking at this  
24 as more generic but I think actually this device  
25 may be one that is well suited for MRI evaluation

1 because of the fact that it is nitinol and I think  
2 you can actually see--some of the ones that have  
3 stainless steel you are not going to be able to do  
4 that but in this particular device I think MR may  
5 be a very good way to follow them. But, basically  
6 they need to have some cross-sectional imaging  
7 follow-up looking for endoleaks which can develop  
8 late, or aneurysm size change which can occur late.  
9 Quite frankly, I am concerned about the fact, and  
10 it is not unique to this device, that the aneurysms  
11 continue to grow even at two years. We don't know  
12 what they are doing at three years, and they can  
13 continue to develop new endoleaks in some of these  
14 patients.

15 DR. LASKEY: Therefore, this kind of  
16 radiologic follow-up is strongly recommended. I am  
17 not sure we can say mandated, though we feel that  
18 way.

19 DR. FREISCHLAG: I think also that needs  
20 to be done for migration issues because in some of  
21 the other grafts they have noted migration late  
22 out. So, you can add that word into it. It may be  
23 helpful for people to know that, even though there  
24 wasn't much seen here.

25 DR. LASKEY: I guess we ought to add late

1 migration then to some of the risks. I am not sure  
2 we mentioned that specifically in one of the prior  
3 questions.

4 Question 4(c), please comment on whether  
5 the instructions for use adequately describe how  
6 the device is to be delivered.

7 I don't think there was much dissent on  
8 that. It is pretty straightforward, complicated  
9 but straightforward.

10 Question 4(d)--do we have other comments?

11 DR. PINA: Warren, let me ask a question  
12 about labeling. In the labeling where you have a  
13 descriptor, like, in a drug side effect profile,  
14 can you add the cause of death? Deaths have been  
15 reported, you know, so many with this; so many with  
16 that. Can you do that?

17 DR. ZUCKERMAN: Yes, typically in our  
18 adverse events section we will summarize the  
19 deaths, number and percentage and, to the best of  
20 our abilities, what the causes of death are thought  
21 to be.

22 DR. LASKEY: Number five is asking us to  
23 comment on the adequacy of the proposed physician  
24 training plan.

25 DR. WHITE: I have a question for the

1 surgeons, and Tony maybe specifically, they don't  
2 discriminate in the training plan between and  
3 operator who is already practicing these devices  
4 and a newby. Do you think that it would be  
5 appropriate to discriminate between somebody who is  
6 already credentialed to be doing this in their  
7 hospital and what it would take to do this safely,  
8 and what it would take for a newby who wanted to  
9 get into this business?

10 DR. COMEROTA: If I am not mistaken,  
11 Chris, in the plan their initial approach is to,  
12 obviously, integrate those who are already doing  
13 the procedure and who already have participated in  
14 the trial, and then move out to others.

15 DR. WHITE: Right, I guess the question is  
16 if they move to somebody who has never seen the  
17 device before but they are already implanting  
18 exclusion devices, should the training for that  
19 person, stranger to this device, be different?  
20 Should you discriminate from the person who just  
21 comes in and says, you know, I would like to put in  
22 stent grafts for the first time?

23 DR. COMEROTA: Well, I think the obvious  
24 answer from my perspective is yes. I think there  
25 ought to be a difference because you are looking at

1 an endovascular education versus a device  
2 education, and there are polar differences there.

3 DR. PERLER: But my understanding of the  
4 program is that there is going to be an assessment  
5 of the prospective user in terms of their ability  
6 to select patients for the procedure and their  
7 performance of the procedure under proctor's  
8 observation. Presumably, that is going to  
9 determine who gets access to the device.

10 DR. COMEROTA: But the proctor is often  
11 the seller. One of the other things that is going  
12 to supersede all of this is that the credentialing  
13 at the institutional level. So, no matter who the  
14 manufacturer of any device is, if the physician who  
15 is going to implant it doesn't have appropriate  
16 numbers for implantation, they can get all the  
17 education they want but they are not going to use  
18 it.

19 DR. WHITE: So, are you saying that the  
20 labeling should say that initially the purchaser  
21 must be credentialed to do this?

22 DR. COMEROTA: No, I don't think we can  
23 get into that at all. That is at the institutional  
24 level.

25 DR. WHITE: Well, no, I am not suggesting

1 we design the credentialing criteria; I am saying  
2 that if you are going to sell this device to a  
3 doctor, should the doctor already be credentialed  
4 at that institution in order to be a customer? Or,  
5 should we stratify the training for the physician  
6 who is not credentialed but who wants to learn how  
7 to put in this device? Should he go through a  
8 different training program than a guy who is  
9 already up and running? That is all. I think that  
10 is simple, but I don't think it has been addressed  
11 here.

12 DR. LASKEY: I think a better term is  
13 experienced rather than credentialed since that is  
14 the governance of the local institution. Anne?

15 DR. ROBERTS: I am sorry, but if I could  
16 just go back to the labeling again, the one thing  
17 that was not clear to me in the labeling is how  
18 much overlap there should be when you put in the  
19 contralateral prosthesis when you go up the other  
20 side. It is not clearly outlined in here as to how  
21 much overlap there should be. They talk about the  
22 extenders and they talk about how much overlap  
23 there should be, but it is one thing that ought to  
24 go in the labeling. You know, what is the ideal  
25 amount of overlap, at least the minimum amount of

1 overlap to avoid having these components come  
2 apart.

3 DR. LASKEY: That is back on 4(c), okay,  
4 great.

5 DR. ZUCKERMAN: Dr. Laskey, there have  
6 been lots of comments on what can be said about the  
7 proposed training program and the label. Usually  
8 we indicate that physicians should have undergone a  
9 training program and leave it at that.

10 DR. LASKEY: I notice the language in the  
11 panel pack discusses institutional volume. I am  
12 sure that would not necessarily be reflected in  
13 writing but that will be a priority of the sponsor?  
14 I mean, the center needs to do an adequate number  
15 of cases to demonstrate proficiency. So, I think  
16 that may take care of itself but it is difficult to  
17 write into language institutional volume. But  
18 these generally will be high volume centers, or  
19 should be.

20 DR. WHITE: Why do you say that, Warren?  
21 There is no reason to believe that these will  
22 generally be high volume centers. Every vascular  
23 surgeon in this country is aware of the need to  
24 offer the alternatives so I don't see any reason  
25 for that.

1 DR. LASKEY: They may not have access to  
2 the device, depending on the criteria put down by  
3 Gore et al. One can only hope that that attains in  
4 real life.

5 Number six, the sponsor proposes a  
6 post-approval study on the patients enrolled in the  
7 pivotal clinical study. Five-year follow-up on all  
8 patients who are alive and not withdrawn from the  
9 study will be obtained in accordance with the  
10 clinical protocol approved. Please comment on the  
11 acceptability of this plan.

12 I think every member of this panel is in  
13 agreement with that and calls for extended  
14 follow-up. I don't know why you want to exclude  
15 patients withdrawn from the study. You may just  
16 want to include everybody.

17 DR. BAILEY: At least for vital status. I  
18 don't see why you can't get vital status on 100  
19 percent.

20 DR. LASKEY: Correct.

21 DR. PINA: Well, there are issues out  
22 there right now about if patients have withdrawn  
23 consent if you can even go check up on vital  
24 status. That is going on in several institutions  
25 right now.

1 DR. LASKEY: If you are alive and provided  
2 consent to participate?

3 DR. PINA: Yes, usually that is very true.  
4 At our IRB out in Los Angeles, if somebody  
5 withdraws from the study you are not allowed to say  
6 hello to them in the hallway. So, once they  
7 withdraw, that means they don't want any further  
8 contact. So, right now that would be a very big  
9 problem in a lot of centers, even though it is in  
10 their best interest to be followed.

11 DR. LASKEY: Well, with that proviso, I  
12 think we are all in agreement that there should be  
13 five-year follow-up that is as inclusive as  
14 possible. I believe that is it for the panel  
15 questions. Am I correct?

16 At this point, I would like to give some  
17 additional minutes to the sponsor and then, if  
18 needed, to the FDA. If you have additional  
19 comments or questions before the vote, please step  
20 forward.

21 DR. ROBERTS: I am sorry, I guess I am  
22 still on West Coast time so there is a delay here.  
23 But I am just wondering about the patients that the  
24 sponsor has, in fact, enrolled in this study that  
25 were sort of additional patients that they got

1 permission to continue putting this device in, I am  
2 assuming that all the data has been collected on  
3 those patients as well. So, it would seem to me  
4 that those patients who have, in fact, been  
5 enrolled even though they are not counted in this  
6 group probably ought to be also followed because  
7 they are just more additional patients.

8 DR. LASKEY: That may be true from a  
9 scientific standpoint but, Dr. Zuckerman, can you  
10 clarify some of the regulatory aspects of this?

11 DR. ZUCKERMAN: Well, if the continued  
12 access registry is basically following the same  
13 protocol and the panel believes that there is a  
14 scientific reason, underlying scientific reason to  
15 obtain more data and that is an obtainable data  
16 set, then that is one possibility if the panel  
17 suggests that this device should be approved with  
18 postmarket surveillance. But I think the key thing  
19 is that one wants to define, first of all, the  
20 question of whether one needs additional data,  
21 other than the numbers talked about on the slide  
22 which come from the original PMA cohort. You know,  
23 there are costs and other factors involved with  
24 looking at additional data sets.

25 DR. ROBERTS: Well, I guess I wouldn't be

1 completely strong on it but it seems to me that  
2 these were patients that the FDA allowed Gore to  
3 continue to place the device in despite the fact  
4 that they had already finished their enrollment.  
5 They are patients that, in fact, are being enrolled  
6 in an experimental protocol. They are patients  
7 that we can get data on, and given the fact that we  
8 know that there is going to be lots of data from  
9 patients as they go along the trial, and we have  
10 already seen that and we have already said, well,  
11 gee, you know, we were not completely comfortable  
12 with some of the numbers, it seems to me like this  
13 might be one way to kind of get around that  
14 uncomfortableness with some of the numbers.

15 DR. ZUCKERMAN: Right, and that is fine if  
16 you can define the reasons why you want additional  
17 data.

18 DR. LASKEY: I made an egregious  
19 procedural error, gentlemen. Please forgive me. I  
20 need to get comments from our representatives from  
21 industry and the consumers at large. I invite you  
22 back to the table. Please forgive me.

23 MR. DACEY: I was very interested in  
24 hearing the comments on the patient labeling  
25 document and physicians because they echoed some of

1 my own concerns. I would like to make it clear  
2 that I have spent many professional years preparing  
3 patient education materials, and I have changed my  
4 thinking over time.

5 The materials that I have seen more and  
6 more, including some of this, are that one side  
7 fits all category. Even though where we are getting  
8 the same demographically, socially and culturally,  
9 the patient population is being much more, both  
10 broadly and specifically, defined and everybody is  
11 trying to communicate to them. When I see a  
12 document such as this patient document going to the  
13 web site, I am beginning to see more and more  
14 marketing and less information.

15 I saw the brochure. It is very well  
16 documented but what I am seeing is a cure, not a  
17 treatment as soon as you start seeing the smiling  
18 faces. It is not unlike what we see on the six  
19 o'clock news with pharmaceuticals. You know,  
20 everybody is offering a cure but not defining the  
21 treatment. And, there is a whole bunch of  
22 responsibilities downstream.

23 So, I have been studying more what is  
24 happening in the social sciences, the  
25 neurosciences, and I would encourage the FDA and

1 sponsors in general to start looking at what works  
2 and what doesn't work, and really helps a clinician  
3 and what really promotes the partnership, and  
4 define some responsibility at the consumer end.  
5 Consumers really need to know. When consumers  
6 become patients they put a great deal of faith in  
7 the science and the practitioners of the science  
8 have to make sure that the patients understand.

9 I understand all the informed consent  
10 issues and all the new HCFA issues, but the basic  
11 thing is we have to raise awareness; we have to  
12 inform. But when you get into education it becomes  
13 a whole new domain that is interactive, and what  
14 they are finding in a lot of cases, especially if  
15 you have to ask people to change behavior, is that  
16 the only thing that works is tutoring. You can't  
17 tutor every patient that comes through a  
18 clinician's door.

19 So, I think we have a whole new  
20 opportunity unfolding, and who knows, in our  
21 post-modern world that is shaping up, patient  
22 education may eventually becomes sort of virtual  
23 reality. But I would like to effuse, if I could,  
24 some of the marketing thrusts that I am seeing in  
25 these kinds of materials where everything is a cure

1 and not a treatment. That is all I have to say.

2 DR. LASKEY: Thank you, Mr. Dacey. Mr.  
3 Ballo?

4 MR. BALLO: From an industry perspective, I  
5 would just like to say I think the FDA, the  
6 industry and even the panel today really had a very  
7 vibrant discussion about all the facts and about  
8 the data.

9 One of the things I think the panel should  
10 consider here is that when industry goes into a  
11 clinical trial--if you look at some of the data  
12 that Gore has presented today, it does show that  
13 from a safety perspective it is equivalent to what  
14 is currently being used for open surgery and for  
15 other graft procedures.

16 In addition to that, we keep on talking  
17 about, from an industry perspective, just like Mr.  
18 Dacey just said, what is good for our patient  
19 population. If you look at some of the other  
20 subset data relative to time in ICU, time to  
21 ambulation, time basically that you are spending on  
22 a patient, taking care of him after a procedure,  
23 obviously the graft procedure, the less invasive  
24 procedure, basically improves upon that.

25 And, one of the things that a device

1 company tries to take into consideration is  
2 improving care for the patient, not improving  
3 procedures for the physician. I would encourage  
4 the panel to think about that and also take into  
5 consideration some of the other data that the  
6 sponsor has presented today which would be  
7 beneficial to the patients.

8 I would just like to thank everybody for  
9 the opportunity to be in this discussion and to  
10 learn a lot about statistics that I really didn't  
11 know before.

12 [Laughter]

13 **Open Public Hearing**

14 DR. LASKEY: Thank you. Is there anyone  
15 in the audience who wishes to address the panel on  
16 today's topic in this portion of the open public  
17 hearing? Yes, sir, please step forward and  
18 identify yourself.

19 DR. OHKI: My name is Dr. Takao Ohki. I  
20 am one of the local PIs, site PI, and I have  
21 hands-on experience with the Gore Excluder graft  
22 and, from that standpoint, I wanted to make a brief  
23 comment. I also have experience with maybe five or  
24 six other endografts.

25 There were only 19 sites I think in the

1 U.S. which were involved in the EBE trial, and we  
2 were fortunate to be one of them. Because the Gore  
3 graft had such a unique advantage over the other  
4 five or six devices, there were many patients that  
5 traveled to our site from other states. I wish  
6 that the panel does not dismiss this valuable  
7 device from becoming accessible to the American  
8 population just based on some statistics. I have  
9 seen patients' lives being saved because of this  
10 device. Thank you.

11 DR. LASKEY: Thank you, sir. One more?  
12 Name, affiliation and potential or real conflict of  
13 interest, please.

14 DR. FELLINGER: My name is Mark Fellingner.  
15 I am a vascular surgeon, from Dartmouth. I am a  
16 local site investigator as well. I otherwise have  
17 no conflict of interest.

18 I want to reflect a little bit of Dr.  
19 Ohki's comments. As a site investigator for many  
20 different devices, I have had experience using this  
21 device as well as both of the commercially approved  
22 devices and other devices currently in clinical  
23 trials. I think that overall some of the  
24 discussion about statistics and that sort of thing,  
25 I mean, I think it is very important to get the

1 statistics right. I think it is also very  
2 important to look at the adverse event rate. It is  
3 dramatically different. The acute recovery, some  
4 of those things, were dramatically different. And  
5 those things shouldn't get lost in discussion about  
6 specific statistical issues. I think it is also  
7 important to get the statistics right.

8 But one thing I can kind of reflect about,  
9 kind of dealing with this company and this group of  
10 people, my experience with them has been very good  
11 in terms of I think they have tried very hard to  
12 get the statistics right, and I don't think there  
13 is any effort here to misconstrue the data in any  
14 way. I think that is important, at least from my  
15 perspective. I think that is incredibly important  
16 whenever I deal with a manufacturer, and I won't  
17 deal with one that I think sugar coats the data. I  
18 don't think they have done that and I thought it  
19 was important for somebody that has kind of been  
20 involved in the process to kind of say that.

21 Thanks.

22 DR. LASKEY: Thank you.

23 DR. GREENBERG: My name is Roy Greenberg  
24 and I am the director of the core laboratory at the  
25 Cleveland Clinic, and also a vascular surgeon that

1 has a large experience with endovascular implants.

2 I just wanted to address a couple of  
3 issues, one of which relates to the fact that I  
4 don't think that anything that was presented in  
5 today's data, or anything that I have seen with  
6 respect to the Gore Excluder device is different  
7 with respect to the fracture rate, endoleak rate,  
8 migration rate or any other radiographic piece of  
9 information that we can say is present in the two  
10 commercially available devices.

11 I also think that the interpretation of  
12 fractures with mechanical devices is something that  
13 we have to be very careful about because it is my  
14 contention that all mechanical devices will  
15 eventually fracture if the patient lives long  
16 enough when we implant them, whether that is a  
17 heart valve or a vascular graft. And, a fracture  
18 rate of three percent or two percent or one percent  
19 is a very low rate associated with any clinical  
20 significance. To ask to see a large number of  
21 fractures to show if there is any relevance  
22 clinically is going to be a very difficult thing  
23 for any company to provide.

24 So, I look at this, if I can extrapolate  
25 just a little bit in terms of the statistical

1 issue, not being a statistician, but the real  
2 problem here was in the original study design with  
3 respect to coming up with a number, which was 80  
4 percent. I would hate to see a device that  
5 compares equal, in my opinion, to other devices  
6 that are already on the market or that are under  
7 investigation to not be granted approval based on a  
8 study design that was done five years ago. Thanks.

9 DR. LASKEY: Thank you. Are there any  
10 other thoughts? Is Dr. White coming forward?

11 DR. RODNEY WHITE: Thank you. Again, my  
12 name is Rod White. I am a vascular surgeon, from  
13 Los Angeles. My conflicts remain the same, and  
14 again, my greatest conflict is I make my living  
15 doing this and I think that is the most important  
16 thing for everybody to keep in consideration.

17 The topics you have brought up are  
18 obviously of great interest, but I think there are  
19 two issues that need to be looked at. One is that  
20 in any of the other studies that have been done  
21 like this, and there is an ongoing problem that the  
22 data set that the core lab has is reliant on  
23 several things: It is what they get from the  
24 centers. Usually the quality of that data is not  
25 as good. Actually, the percentage that have been

1 evaluated or can be evaluated in many of these, if  
2 it is 70 or 80 percent it is pretty good. So, I am  
3 not troubled by that number in particular.

4 I think what needs to be looked at and the  
5 greater consideration is that the data sets that  
6 lead to the clinical treatment, what physicians  
7 treat these patients related to, are the x-rays.  
8 If there is a leak or some abnormality, that  
9 clinical data set is generated on the clinical set,  
10 not the core lab set. That comes later and does  
11 not have an impact on what is the efficacy data  
12 that has been presented.

13 So, my take, and I don't know because I am  
14 not an investigator in this study and have only an  
15 overview of the other data sets globally, is that  
16 probably 95 percent or better of these patients did  
17 have studies and that the clinical treatment was  
18 based on what the physician saw that day when they  
19 saw it, and that algorithm is what the data set is  
20 relevant to.

21 So, I understand Chris' point about the  
22 core lab set and its relevance and what percentage  
23 is there but, again, that number means that 70  
24 percent of the data was interpretable and that  
25 should match what the other data sets are provided

1 by the manufacturer, and from what I have heard  
2 today I think they do that.

3 But I would remind everybody that when you  
4 are in an acute situation you get the studies, you  
5 intervene and the data set you are evaluating is  
6 based on that clinical data set and the core lab  
7 comes in later and verifies that but has no  
8 relevance or impact on the clinical data set  
9 itself. I think that is one of the issues that has  
10 to be looked at in any of these studies. The core  
11 lab is an important data set but it doesn't  
12 determine the clinical treatment.

13 The other thing that has been a relevant  
14 consideration is whether or not this represents  
15 what is the state-of-the-art and the patient need.  
16 I must say to you again, just from a conflicted  
17 person who takes care of these patients, the  
18 patients have looked at this information and in  
19 their own mind feel that this is a very important  
20 therapy and that is one of the reasons that it is  
21 clinically available. So, I think it is an  
22 important study and the manufacturer has done an  
23 excellent job of presenting it. Thank you.

24 DR. LASKEY: Thank you. I think we can  
25 all agree that a clinical trial design should be

1 both scientifically valid as well as trying to  
2 mimic as much of the clinical reality as possible.  
3 Thank you. Any other comments? If not, then I  
4 would like to close the open public hearing and ask  
5 for any final comments from the FDA.

6 **Final Comments from the FDA**

7 MS. ABEL: I am Dorothy Abel. I am one of  
8 the lead reviewers on this document and actually  
9 have been involved in the review of these devices  
10 since their inception, probably longer than anyone  
11 else in the room.

12 One thing that I think is clear is that  
13 over time the more we learn about these devices,  
14 the more we learn that we focused on the wrong  
15 thing over time. What we have attempted to do is  
16 to find some useful surrogate endpoints to evaluate  
17 whether or not these devices are effective in  
18 avoiding aneurysm rupture.

19 Now, we can't design studies to look at  
20 aneurysm rupture. Many years ago when we started  
21 to look at these studies we thought we would look  
22 at aneurysm exclusion because, obviously, if it is  
23 not excluded there is still the potential for  
24 rupture. What we have learned over time is that  
25 endoleak in itself doesn't appear to be a good

1 surrogate endpoint and I think that needs to be  
2 taken into consideration when you are concerned  
3 about how complete that particular piece of  
4 information is.

5 I think we are still struggling with the  
6 best way to evaluate these devices, but I just want  
7 to caution that, again, this was a definition that  
8 was made sometime ago and you need to think about  
9 the state-of-the-art with respect to the definition  
10 of success with these devices. We actually have  
11 some companies that have retrospectively gone back  
12 and said in our PMA we are not only going to  
13 evaluate the data in accordance with the way that  
14 we designed the study many years ago, but we are  
15 also going to do these additional analyses because  
16 they are more appropriate according to what we know  
17 now.

18 This company didn't happen to do that. I  
19 think possibly it would have been a good idea, and  
20 maybe we should have asked them to do that because  
21 then you would have a better concept of what the  
22 focus currently is but we are where we are. That  
23 is it.

24 DR. LASKEY: Dr. Zuckerman? No?

25 DR. ZUCKERMAN: No other comments.

1                   **Final Comments from the Sponsor**

2                   DR. LASKEY: Dr. Matsumura and colleagues,  
3 please.

4                   DR. MATSUMURA: Thank you. I won't take  
5 much time because the public speakers have  
6 basically taken all the points I wanted to make but  
7 there are just two I think I have left. Can you  
8 show slide 76?

9                   [Slide]

10                  There was some concern that there may be  
11 some missing data at 12 months. I showed  
12 accountability of patient visits but we do have  
13 accountability for CT and I want to point out that  
14 the sites did get CT scans on 199 or 93 percent of  
15 patients at 12 months, and that the core lab  
16 received 196 of those scans. As pointed out, 40 of  
17 those were not evaluable for endoleak; they were  
18 evaluated for other things.

19                  As the point has been made, FDA has said  
20 that the statistical efficacy endpoint was not made  
21 as defined a priori and we have gone over that  
22 several times, but I think it is important to  
23 realize that there is evolving knowledge in  
24 clinical practice. What we thought five years ago  
25 was important to look at, we are learning new

1 things about.

2 I want to emphasize the clinical data that  
3 we presented, the aneurysm-related survival is  
4 similar in both groups, which is now the primary  
5 outcome measurement as defined by the joint  
6 societies.

7 The clinical effectiveness--there are very  
8 few reinterventions, six to seven percent a year,  
9 rare conversions and no aneurysm ruptures. I would  
10 ask the panel to consider what we consider in 2002  
11 to be measures of effectiveness when they evaluate  
12 the efficacy. Thank you.

13 DR. LASKEY: Thank you, Dr. Matsumura.  
14 Dr. Harvey, would you read us the voting options,  
15 please?

16 **Recommendations and Vote**

17 DR. HARVEY: Thank you, Dr. Laskey. I  
18 will read to the panel their recommendation options  
19 for premarket approval applications. The Medical  
20 Device Amendments to the Federal Food, Drug and  
21 Cosmetic Act, known as the Act, as amended by the  
22 Safe Medical Devices Act of 1990, allows the Food  
23 and Drug Administration to obtain a recommend from  
24 an expert advisory panel on designated medical  
25 device premarket approval applications, or PMAs,

1 that are filed with the agency.

2 The PMA must stand on its own merits and  
3 your recommendation must be supported by safety and  
4 effectiveness data in the application or by  
5 applicable, publicly available information.

6 Safety is defined in the act as reasonable  
7 assurance, based on valid scientific evidence, that  
8 the probable benefits to health under conditions of  
9 intended use outweigh any probable risks.

10 Effectiveness is defined as reasonable  
11 assurance that in a significant portion of the  
12 population the use of the device for its intended  
13 use and conditions of use, when labeled, will  
14 provide clinically significant results.

15 Your recommendation options for the vote  
16 are as follows. Number one, approval if there are  
17 no conditions attached.

18 Number two, approvable with conditions.  
19 The panel may recommend that the PMA be found  
20 approvable subject to specified conditions, such as  
21 physician or patient educations, labeling changes,  
22 or a further analysis of existing data. Prior to  
23 voting, all of the conditions should be discussed  
24 by the panel.

25 Number three, not approvable. The panel

1 may recommend that the PMA is not approvable if the  
2 data do not provide a reasonable assurance that the  
3 device is safe, or if a reasonable assurance has  
4 not been given that the device is effective under  
5 the conditions of use prescribed, recommended or  
6 suggested in the proposed labeling.

7           Following the voting, the Chair will ask  
8 each panel member to present a brief statement  
9 outlining the reasons for their vote.

10           DR. LASKEY: Thank you. I now ask for a  
11 motion from one of our reviewers. Dr. Comerota?

12           DR. COMEROTA: Dr. Laskey, I move that the  
13 Excluder device be approved with two conditions.

14           DR. LASKEY: And they are?

15           DR. COMEROTA: Five-year follow-up on all  
16 patients so treated is condition number one. As  
17 condition number two, mandatory annual imaging  
18 evaluation appropriate to identify aortic aneurysm  
19 enlargement, endoleak or wire-form fracture.

20           DR. LASKEY: As a point of clarification,  
21 for the follow-up you want just actuarial survival  
22 follow-up, or what other information is included in  
23 the follow-up that you are recommending?

24           DR. COMEROTA: I suppose that is included  
25 in the second condition of annual imaging.

1 DR. LASKEY: Do you want to capture reops  
2 or interventions? What should be captured in the  
3 five-year follow-up?

4 DR. COMEROTA: All adverse events.

5 DR. LASKEY: Okay. We have a motion. We  
6 need some discussion and we need to separate the  
7 discussion along the lines of the two conditions.  
8 Do I have a second for the motion?

9 DR. PERLER: I second the motion for  
10 discussion.

11 DR. LASKEY: Before we move from there, we  
12 do need to separate them out in terms of the two  
13 conditions on that motion. So, is there any  
14 discussion on the need for the five-year follow-up  
15 with adverse clinical events? I think we are all  
16 in agreement that that is requisite. If we have  
17 agreement, can we have a panel vote on Dr.  
18 Comerota's motion to approve with condition one  
19 being five-year clinical follow-up? All in favor?

20 DR. COMEROTA: We are voting on the  
21 condition, right? Not on the motion to approve?

22 DR. LASKEY: That is correct, just on the  
23 condition.

24 DR. PINA: Warren, as an order question,  
25 if we want to amend Dr. Comerota's recommendation

1 and add other conditions is this the time to do it,  
2 or do we wait to vote on one and two?

3 DR. LASKEY: I think we need to do each  
4 condition in its own right. So, we will just vote  
5 on the present condition and then if we need to add  
6 more, we will vote on them. So, can we have a show  
7 of hands for the approval for the first condition  
8 to the motion for approval, the first condition  
9 being five-year clinical follow-up?

10 DR. BAILEY: Is that for both groups?

11 DR. LASKEY: For the data set.

12 DR. COMEROTA: This is approval for  
13 patients who will be treated henceforth.

14 DR. BAILEY: This has nothing to do with  
15 the extended follow-up of the current cohort.

16 DR. LASKEY: They have already stated that  
17 they plan to do surveillance on the pivotal  
18 clinical data set. This applies to patients in  
19 whom this will be implanted from here on. Is that  
20 correct?

21 DR. COMEROTA: Right.

22 DR. ROBERTS: Wait a minute, we are asking  
23 them to follow all patients that get this device  
24 for five years?

25 DR. COMEROTA: That is correct.

1 DR. LASKEY: For clinical adverse events.

2 DR. ROBERTS: Oh, I don't think that is  
3 possible. I mean, you are saying that every single  
4 patient that this device gets put into from hereon  
5 that they are going to study those patients?

6 DR. COMEROTA: I think that what we have  
7 recognized, as a medical profession, is that as  
8 time goes on after aortic endografts have been  
9 implanted there is an increasing number of patients  
10 developing complications. I think it is our  
11 responsibility to identify those patients, protect  
12 them from those complications and to quantify it  
13 for any future devices coming on the market.  
14 Hence, the reason for the condition.

15 DR. ROBERTS: Well, I can't vote for that.  
16 I mean, that could be hundreds of patients that you  
17 are asking the sponsor to spend, you know, hundreds  
18 and thousands or millions of dollars trying to  
19 follow. I mean, it is very appropriate I think to  
20 follow the patients that have already been enrolled  
21 in the study, and I would even suggest the ones  
22 that were additionally enrolled in the study. But  
23 to follow every patient that gets this device, I  
24 just don't think that is practical.

25 DR. AZIZ: Isn't that done for heart

1 valves and pacemakers?

2 DR. COMEROTA: It is not unique. We are  
3 not precedent setting. It is following precedents  
4 for other implantable devices.

5 DR. ZUCKERMAN: Let me give a point of  
6 clarification. To follow every patient who gets a  
7 chronic implant for five years post FDA approval  
8 would be quite precedent setting. Again, the way  
9 that FDA looks at a conditions of approval study or  
10 a postmarket study really is what is the scientific  
11 question that we are trying to answer, and then to  
12 try to develop a sample size and a hypothesis to  
13 answer that question, as opposed to, you know, just  
14 looking at the whole universe.

6:00 15 p.m.

DR. LASKEY: Well, we can  
16 agree we need survival status over the five-year  
17 interval. Is that correct?

18 DR. COMEROTA: Let me try to clarify this.  
19 My intent is that we, as clinicians who implant any  
20 device or take care of any patients, need to follow  
21 our patients properly. I don't necessarily mean to  
22 shift that onus onto someone else, other than our  
23 own shoulders. Perhaps the message that ought to  
24 be conveyed is that once this device, or any  
25 endograft, is implanted these patients need careful

1 follow-up over prolonged periods of time with  
2 appropriate imaging studies. Perhaps I didn't word  
3 the conditions properly.

4 DR. PERLER: I misunderstood the  
5 condition. I thought you were referring to the  
6 pivotal study population. I think one of the  
7 problems with accommodating your condition is that  
8 often the physician placing the device is not going  
9 to be the physician following the patient long  
10 term. I think this is not only a logistical and  
11 economic challenge for the sponsor but it also is  
12 going to be for the physician who places the  
13 devices. I agree with Anne, I don't think it is  
14 doable.

15 DR. COMEROTA: Who is going to take that  
16 responsibility? Would you argue that it needs to  
17 be done, Bruce?

18 DR. PERLER: Oh, I agree and I try to do  
19 it with my patients and communicate what I think  
20 needs to be done when those patients are not being  
21 followed by me. I think we certainly can urge the  
22 company to inform those practitioners placing  
23 devices that they need to follow the patients or if  
24 they are not, to communicate what needs to be done  
25 to the patient's primary physician.

1 DR. COMEROTA: Well, I will tell you that  
2 the institution where I currently reside--I am  
3 impressed that your initial observation is true  
4 that primary referring physicians fall down  
5 significantly. I will also tell you that there is  
6 a responsibility that is assumed by the physicians  
7 who put the device in to make sure that those  
8 follow-up visits are properly performed. And, I  
9 will also tell you that there are graft-related  
10 problems that have been identified in asymptomatic  
11 patients over long-term follow-up because of this  
12 dogged pursuit of good follow-up. So, whose  
13 responsibility is that? I am not necessarily  
14 trying to shift the responsibility from the  
15 physician, but I am saying that it needs to be  
16 done, especially in devices such as this that have  
17 been demonstrated to increase problems over time.

18 Somehow, I think, we need to integrate  
19 that into a recommend. Now, it may not have to be  
20 the responsibility of the manufacturer, but it has  
21 to be one of the patient care provider's  
22 responsibilities.

23 DR. ZUCKERMAN: Let me interject here.  
24 Usually the way that those points are brought into  
25 a recommendation is through adequate labeling, both

1 in the IFU and the patient labeling, and also  
2 perhaps an appropriate design of a postmarket study  
3 that can answer specific scientific questions. But  
4 there is a line where the notion of professional  
5 responsibility for physicians still has to be  
6 accepted. The agency has to be cognizant that it  
7 can't replace the role of physicians.

8 DR. LASKEY: It is interesting that at the  
9 outset of this meeting the very first thing we  
10 heard about was a large-scale registry in which  
11 every patient with device implanted would be  
12 followed voluntarily, and so forth. So, there is  
13 certainly a movement within the profession to  
14 obtain long-term detailed follow-up with hundreds  
15 of data fields in these databases. So, I don't  
16 think this is very far off the mark, but we are  
17 aware of the onus put upon the third party.

18 DR. SIDAWY: Yes, and I don't think we  
19 should forget that since there are no such  
20 conditions placed on other manufacturers of similar  
21 devices, I think placing such a condition on the  
22 sponsor will have a differential advantage or  
23 disadvantage in marketing these devices. We should  
24 strongly suggest to the people who are implanting  
25 these devices, physicians, to recommend to them to

1 voluntarily report to such registries and ask them  
2 to follow these patients, but I don't think we  
3 should place that condition on the sponsor.

4 DR. LASKEY: As a consequence of this  
5 discussion, are we moving towards a distillation of  
6 your first condition to involve survival over five  
7 years, or where are we going with this?

8 DR. COMEROTA: Let me try to clarify that,  
9 Warren. Perhaps it would be best included in a  
10 labeling recommendation rather than a condition for  
11 approval. I think that wording and that guidance  
12 is very appropriate, and I would be very happy to  
13 either modify it or withdraw the condition.

14 DR. LASKEY: You need not withdraw it; you  
15 can just apply it to labeling. That would be a  
16 different condition, to have that language applied  
17 to labeling.

18 DR. COMEROTA: I would so modify that to  
19 have the five-year follow-up, a minimum of a  
20 five-year follow-up applied to a labeling condition  
21 as a recommendation to physicians.

22 DR. LASKEY: Discussion on that?

23 DR. PINA: This is supposing that the  
24 sponsor will continue following the patients in the  
25 pivotal trial?

1 DR. COMEROTA: Right.

2 DR. PINA: I mean, I would like to see the  
3 five-year data on the pivotal trial, both the  
4 control group and the study group.

5 DR. ROBERTS: I think that is what the  
6 condition should be. I mean, they have said that  
7 they will do that but it probably should come from  
8 the panel as a condition that they have to do that;  
9 that there has to be a follow-up of the study  
10 patients over five years, with a report on a yearly  
11 basis regarding the appropriate parameters and,  
12 presumably, that is aneurysm rupture, adverse  
13 events, endoleaks, increased size of the aneurysm,  
14 those types of things. I think that it probably  
15 ought to go into there.

16 I am a little concerned, quite frankly,  
17 about this idea of somehow putting in the labeling  
18 that patients have to be followed for five years  
19 with data collected, or something. I am not sure  
20 actually that is appropriate for the labeling. It  
21 may be something that is more appropriate in the  
22 training, when the company goes to set up their  
23 training materials that something should be in  
24 there that is, you know, encouraged or strongly  
25 suggested that the information from the patients be

1 entered into the registry, or something along those  
2 lines.

3 DR. PINA: Actually in the patient  
4 brochure as well because I think the patients need  
5 to be educated that follow-up is critical, and the  
6 suggestion that follow-up be done by the physician.

7 DR. LASKEY: That came up with Julie's  
8 point in the patient information package. We have  
9 moved now to approvable with one condition, which  
10 is that there be comprehensive mandatory five-year  
11 follow-up in the pivotal clinical data set, to  
12 include not just survival status but specific  
13 radiographic information. Do you want to further  
14 specify what that is, and are we going to write in  
15 here CT, MRI? Where will we stop?

16 DR. FREISCHLAG: I would recommend for  
17 this pivotal group that we put those in because,  
18 obviously, we spent a lot of time asking where  
19 those were today, and I think this would be great  
20 and make a lot of us, especially me, feel good. If  
21 we did specify we want CT scans and KUBs in these  
22 patients really for five years, it certainly would  
23 make me feel good, and I think we also would get a  
24 great data set.

25 DR. BAILEY: Perhaps we could add with

1 appropriate attention to missing data and  
2 description thereof.

3 DR. LASKEY: Okay, we have approvable with  
4 a single condition, comprehensive in its scope but  
5 requiring five-year follow-up clinical and  
6 actuarial. Is that a reasonable approach?

7 DR. COMEROTA: For condition number one.

8 DR. LASKEY: Well, we are folding number  
9 two in. We are folding the radiologic information  
10 into the follow-up information.

11 DR. COMEROTA: Actually no, my intent for  
12 condition number two was that the treating  
13 physician or the person responsible for patient  
14 care provide an appropriate imaging modality to  
15 identify aortic aneurysm enlargement, endoleak or  
16 wire fracture at least for five years on an annual  
17 basis. That would be included in the  
18 recommendations for use.

19 DR. NAJARIAN: I think it is somewhat too  
20 structured to recommend a time frame. I think that  
21 is something that could be put in the labeling or  
22 even the training, that it is highly recommended  
23 that patients be followed with KUB and CT on a  
24 one-month, six-month and then yearly basis, and  
25 leave it at that.

1 DR. COMEROTA: Okay, that is acceptable.

2 DR. LASKEY: Then let's vote on the first  
3 condition. Do we have consensus on the first  
4 condition at least, which was the comprehensive  
5 five-year follow-up for the pivotal data set?  
6 Let's see a show of hands.

7 [Show of hands]

8 All right, unanimous approval for the  
9 first condition. Now, for your second condition, I  
10 am a little unclear on the nature of this.

11 DR. COMEROTA: In terms of part of the  
12 labeling, the recommendations for use, Ken, did you  
13 want to rephrase the condition?

14 DR. NAJARIAN: There are several things we  
15 want to put into the labeling. I don't know that  
16 those need to be conditions. Maybe we could  
17 discuss those. Everybody brought up some pretty  
18 good points on the labeling. One thing on the  
19 labeling I think Tony is trying to get at is that  
20 it is highly recommended that the patients have  
21 adequate imaging follow-up, or suggested at, you  
22 know, one-month, six-month and yearly intervals,  
23 and that follow-up should include CT and KUB. Of  
24 course, that is at the discretion of the implanting  
25 physician and patients will be lost to follow-up.

1 DR. COMEROTA: That worries me. I am not  
2 so sure it should be at the discretion of the  
3 implanting physician. You can't just put a graft  
4 in like this and say good-bye. We will see you  
5 whenever we see you.

6 DR. NAJARIAN: But there is a  
7 responsibility that we all have as physicians, and  
8 I don't think you want to dictate clinical practice  
9 or how people follow their patients.

10 DR. COMEROTA: But you always dictate  
11 clinical practice by the indications for use.

12 DR. LASKEY: I am not sure the FDA or we  
13 can mandate any of this.

14 DR. COMEROTA: Well, we are recommending.

15 DR. NAJARIAN: I understand what you are  
16 trying to get at but, again, the purpose of this  
17 committee is to decide on the safety and  
18 effectiveness, and that data is here before us now  
19 and we have recommended a five-year follow-up of  
20 the patients in the pivotal study and that should  
21 get us somewhere.

22 DR. ROBERTS: If you look at the labeling,  
23 number three, under completion of the procedure, it  
24 says follow up patients as necessary to provide  
25 proper surveillance of long-term procedure of the

1 endoprosthesis procedure and status of the  
2 aneurysm. Annual CTs and various views of x-rays  
3 may be used for such surveillance. I think that  
4 that sort of almost gets it, but I think it has to  
5 be stronger and that instead of follow up patients,  
6 it should be something like patients must undergo  
7 surveillance of the long-term performance of the  
8 endoprosthesis. The FDA will probably work that  
9 language, but I think that what we need to  
10 recommend is that it really be forcefully indicated  
11 in the label that these patients need to undergo  
12 follow-up on an annual basis.

13 DR. COMEROTA: And, I am not suggesting  
14 the imaging modality. If, four years out, the  
15 patient has a cardiac cath and there is an IVUS  
16 being passed and you can look at the graft with the  
17 IVUS in the process of doing the cardiac cath, that  
18 is great; that is good imaging modality and it may  
19 be appropriate. We don't know what ultrasound will  
20 be. We don't know what MRA or MRI will be in the  
21 future and they may be appropriate. So, we are not  
22 dictating the imaging modality. I am only  
23 suggesting that these patients need to be  
24 objectively followed on a routine basis for the  
25 long term.

1 DR. WHITE: I am really afraid we are  
2 overstepping our bounds. I think I would not like  
3 to have my practice regulated by an indication for  
4 use. I would not like to have a plaintiff attorney  
5 running around saying, Dr. White, why didn't you  
6 follow this? Why am I responsible for the guy who  
7 leaves my territory or goes some place else?

8 I am not arguing with what you are saying,  
9 Tony, as being good clinical practice but I think  
10 that putting it down in an indication for use is  
11 probably not the right way to get physicians to do  
12 it.

13 DR. ROBERTS: It is already in there,  
14 Chris.

15 DR. WHITE: Required to be followed?

16 DR. ROBERTS: Well, read number three,  
17 indications for use, it basically says that. We  
18 are just saying it needs to be a little stronger.

19 DR. LASKEY: We may not then need to make  
20 this a condition. I don't know what you think, Dr.  
21 Zuckerman, but it doesn't sound like there is  
22 enough oomph here to make this a condition. If it  
23 is a fine-tuning of the language, I guess that is  
24 something we can live with.

25 DR. ZUCKERMAN: Yes, you know, one

1 possibility is that a condition of approval would  
2 be that the FDA would seriously look and the  
3 sponsor would seriously look at all the labeling  
4 comments suggested both during this present  
5 discussion and the prior discussions regarding  
6 fine-tuning of the indications etc.

7 DR. SIDAWY: Mr. Chairman, I would like to  
8 recommend that the FDA look at the language that  
9 they have for other manufacturers and use the same  
10 language for this one.

11 DR. LASKEY: Again, that need not be a  
12 condition. I think you can do that off line. I  
13 think we simply have one condition on this motion,  
14 which at the present time makes life easy.

15 DR. FREISCHLAG: I would like to make a  
16 suggestion which is a little bizarre. Could a  
17 condition be that those 40 CT scans that we know  
18 exist, that we know were mailed, can they be  
19 reviewed and that data reported to us so that we  
20 get the 196? I think she gave me a window when she  
21 said that it is not normal to do that but they have  
22 the 40 scans; they just didn't like the way they  
23 looked. Can't they reprocess? They are all on  
24 computers. They can be re-looked at. I have a  
25 feeling they all could do that tomorrow if we asked

1 them, and that would make me feel great. So, I  
2 would like to make a condition that the 40 CT scans  
3 that we know were mailed to Cleveland be reviewed  
4 and that data given to us on endoleaks.

5 DR. LASKEY: Or given to the FDA. That is  
6 not unreasonable to complete the data set.

7 DR. ZUCKERMAN: No, frequently that is  
8 requested by the panel if the data are available.

9 DR. LASKEY: Can we vote on the second  
10 condition? Actually, the motion was made for a  
11 condition, can I hear a second?

12 [The motion was duly seconded]

13 All in favor of the second condition, that  
14 being the acquisition of the outstanding serial CT  
15 data? All in favor?

16 [Show of hands]

17 Unanimous. Thank you. That is two  
18 conditions.

19 DR. PINA: This is the time to enter a  
20 third condition. I would like to move that the  
21 physician education packet be amended to stress the  
22 source of the mortality and the co-morbidities, and  
23 to stress to the practicing practitioner who is  
24 inserting the graft that these patients need to  
25 continue to be followed very closely either by a

1 cardiologist or by their primary care physician,  
2 but with close attention paid to the  
3 co-morbidities, and that these items of close  
4 follow up be added to the patient education booklet  
5 as well.

6 DR. LASKEY: It sounds reasonable.  
7 Certainly, the latter is easy to do, to fold that  
8 into the patient brochure and make it clear about  
9 the follow-up with their doctor. I don't know  
10 about the first one though, how we can craft that  
11 language to basically be a diligent physician.

12 DR. PINA: Well, you may want to leave it  
13 to the FDA to craft the language but I think the  
14 point needs to be made that the morbidity and  
15 mortality is not always directly related to the  
16 graft itself but perhaps to the co-morbid  
17 conditions and that they cannot be overlooked. So,  
18 they can certainly put that in the physician  
19 instruction. That is not mandating practice; it is  
20 recommendation, not mandating.

21 DR. LASKEY: Do we need to vote on this  
22 one? It is kind of soft. Do you want to make it  
23 formal?

24 DR. PINA: Yes, I want to make it formal.

25 DR. LASKEY: May I hear a second to Dr.

1 Pina's motion to institute language along the lines  
2 of scrupulous attention to cardiovascular risk  
3 factors following implantation?

4 [The motion was duly seconded]

5 Thank you. All in favor?

6 [Show of hands]

7 Dr. Pentecost, no?

8 DR. PENTECOST: No.

9 DR. LASKEY: Thank you. That is condition  
10 three.

11 DR. AZIZ: Warren, let me just ask a  
12 question. Once those 40 scans are reviewed and you  
13 find some disconcerting data, what happens?

14 DR. FREISCHLAG: The plan is that is not  
15 going to happen.

16 DR. AZIZ: Seriously, what do you do then?

17 DR. FREISCHLAG: They would probably have  
18 to let us know about it.

19 DR. ZUCKERMAN: The usual tack that the  
20 agency takes is that there would be an internal  
21 review. If the data are appropriate and consistent  
22 with what has been discussed today, the agency  
23 would probably handle the situation internally.  
24 But if there are big problems that develop we  
25 always have the option of going back to panel and

1 discussing these data.

2 Dr. Laskey, on the last motion I wasn't  
3 sure of the vote, motion number three by Dr. Pina.

4 DR. LASKEY: Condition number three, you  
5 mean the language or the vote?

6 DR. ZUCKERMAN: I am not sure that the  
7 vote is a positive one. I didn't see all hands up.

8 DR. LASKEY: We need to raise our hands  
9 higher, folks.

10 [Show of hands]

11 That condition carries.

12 DR. ZUCKERMAN: Thank you.

13 DR. LASKEY: Additional conditions? We  
14 have had it! I would now ask Dr. Harvey to restate  
15 the conditions of approval in order to have the  
16 panel make a final vote.

17 DR. HARVEY: All right, I will paraphrase  
18 here. The first one was mandatory five-year  
19 follow-up on all the patients in the pivotal study  
20 cohort.

21 DR. LASKEY: Recommend approval with the  
22 following conditions.

23 DR. HARVEY: Right.

24 DR. LASKEY: Number one?

25 DR. HARVEY: The first condition was

1 mandatory five-year follow-up on all the patients  
2 in the pivotal study cohort. The second condition  
3 was to obtain the outstanding information on the 40  
4 CTs. That information should be submitted to FDA,  
5 reviewed and reported to the panel. The third  
6 condition was that the IFU should stress the  
7 sources of co-morbidities and mortality, and that  
8 the patient labeling or brochure should include  
9 this information as well.

10 DR. ZUCKERMAN: Let me ask one question.  
11 On condition number two, is it that the 40 CT data  
12 should be obtained and reviewed, not necessarily  
13 brought back to panel unless major questions arise.

14 DR. LASKEY: Right.

15 DR. HARVEY: So to clarify it, it should  
16 be brought back to the agency and reviewed by the  
17 agency.

18 DR. NAJARIAN: I just have a question. As  
19 far as conditions, did we address in the condition  
20 the external iliac artery size, and should that be  
21 a condition? That is in the label?

22 DR. ROBERTS: Yes. I wouldn't make that a  
23 condition but definitely I think the FDA has heard  
24 the concern about the iliac--

25 DR. LASKEY: Recommendation that the

1 dimensional data be put in.

2 DR. ROBERTS: Yes, and I would, just so it  
3 doesn't get lost, also recommend--and I am not  
4 going to make this a condition for approval, but  
5 also recommend that the patient brochure really  
6 indicate to the patients the fact that there may be  
7 follow-up that needs to be done in terms of imaging  
8 follow-up but then also perhaps in terms of therapy  
9 so that they don't have a false idea of what they  
10 are getting into.

11 DR. HARVEY: So, based on those three  
12 conditions and the motion for approvable with those  
13 conditions, we can now take a vote.

14 DR. LASKEY: We will do a show of hands  
15 and then we will go around and we will adjourn.  
16 Can we have a show of hands to support the  
17 recommendation to approve with those three  
18 conditions?

19 [Show of hands]

20 DR. HARVEY: If we could go around the  
21 table and hear the person's vote and their reason  
22 for that vote.

23 DR. AZIZ: I think the device has been  
24 shown to be safe, but I do have some concerns about  
25 the 40 patients that were missing but I think now

1 that the data will be provided and looked at, and  
2 could influence what the FDA recommends I feel  
3 satisfied to approve it with conditions.

4 DR. COMEROTA: The reason for my vote was  
5 based upon 19 centers, 19 investigators implanting  
6 the device with 100 percent success rate, no  
7 aneurysm rupture in follow-up, no conversions in  
8 the first two years, and only three conversions  
9 thereafter, translating to less than 1.5 percent  
10 conversion rate in more than two years;  
11 significantly fewer adverse events than operated  
12 patients in this prospective trial. While bothered  
13 by less than 100 percent follow-up of CT scans,  
14 realizing that many prospective randomized trials,  
15 when imaging modalities are used as an endpoint,  
16 oftentimes there is somewhere between a 20-40  
17 percent drop-off rate in evaluable imaging  
18 modalities over time. So, this seems to fit with  
19 what we have seen in the literature, and I think  
20 the bottom line is this device is good for  
21 patients.

22 DR. PENTECOST: I would support this and  
23 echo the sentiment very confidently that I think  
24 this is a good device for patients. I think we  
25 have heard a lot about endoleaks and also the

1 dynamics of aneurysms after they have been stented  
2 over the last five years. So, I think we can be  
3 excused for not having thought of all these  
4 criteria up front, but we don't have any excuse for  
5 it now and I think we need to be very scrupulous in  
6 the way we follow patients with endoleaks over  
7 time. The agency should insist on that, and we  
8 should also look very carefully at the dynamics,  
9 the measurements etc. of the aneurysmal sac which  
10 persist after these are in place.

11 DR. BAILEY: I voted for approval. I  
12 believe this device does represent a useful option  
13 for patients based on the data that have been  
14 presented; that there are fewer acute problems than  
15 with surgery. I think the efficacy issue and what  
16 the number is, is not a trivial issue but I think  
17 despite the presentation which I think could have  
18 been a lot clearer, there is significant evidence  
19 of reasonable efficacy. I don't think it is fair  
20 to say it is 80 percent but I think it is  
21 reasonably high. So, almost sort of despite the  
22 confusing presentation, I think there is a good  
23 product there. I would just encourage a more clear  
24 presentation of the efficacy data which I do think  
25 is important.

1 DR. SIDAWY: I voted affirmatively because  
2 I felt that this device will give a good option to  
3 the patient. It has some characteristics in ease  
4 of deployment that may differentiate it from other  
5 devices available. My concerns were related to the  
6 absence of the CT scans and the condition that we  
7 voted on satisfies that and, therefore, I voted  
8 affirmatively on this device.

9 DR. FREISCHLAG: Ditto. I voted yes for  
10 similar reasons as Tony, and have confidence that  
11 the follow-up will be excellent by the Gore company  
12 for us to learn more about how aneurysms change  
13 over time. I think that is what we have learned  
14 from the last two years when these devices have  
15 been approved. There is a lot more that goes on  
16 after the device is put in and before the device is  
17 put in, and we just need to pay attention.

18 DR. NAJARIAN: Yes, I voted for approval  
19 with the conditions. I think the sponsor has done  
20 a very good job of showing us that this is a safe  
21 and effective device even though we have had some  
22 difficulty with the statistics. I am not sure I  
23 remember which one is the numerator or the  
24 denominator anymore; I have to review that when I  
25 get home. But I think it is probably going to be a

1 very good device and very applicable in this  
2 patient population.

3 DR. ROBERTS: I voted for approval because  
4 I am also impressed with the ability of the  
5 operators to get the device in place in all of the  
6 patients, as well as the safety profile of the  
7 device compared to the control, and I think that,  
8 hopefully, with good follow-up we won't be  
9 disappointed with our vote.

10 DR. PERLER: Well, I voted for approval.  
11 Based upon my clinical experience and based upon  
12 the data presented today, I am convinced this is a  
13 safe and effective device. The fundamental  
14 question for me is very simple, would patient care  
15 be advanced by approval of this device or  
16 rejection, and I think that is a very easy  
17 question. I think it is going to be advanced and  
18 that is why I voted that way.

19 DR. WHITE: Too late to change?

20 [Laughter]

21 I find myself in the position of minority.  
22 I know that this is a good device and I know that  
23 it has been implanted with tremendous success. In  
24 fact, I am always suspicious about 100 percent  
25 success. Be that as it may, I don't think it met

1 the criteria for the approval and there had to be a  
2 reasonableness of efficacy, and I believe that just  
3 on the face of the data the reasonableness of  
4 efficacy was not shown and so I voted no.

5 DR. PINA: I think that keeping older  
6 patients away from surgery that very often brings  
7 other complications is a good thing. So, I think  
8 that overall this is going to add to the patient  
9 care in this population that tends to be more  
10 frail, and the ability to get them up and moving  
11 earlier and getting them back to their regular  
12 activities is a benefit. I have been concerned, as  
13 Dr. White has been, with the missing CT scans and,  
14 hopefully, with our conditions these will be met  
15 and, hopefully, better physician and patient  
16 education as well.

17 DR. LASKEY: Thank you, colleagues. Any  
18 final words from Mr. Dacey and Mr. Balo?

19 MR. DACEY: No.

20 MR. BALO: I really think, from my  
21 perspective, you know, we spent a lot of time going  
22 through a lot of details and trying to get a better  
23 clarification of the data, but I do agree with what  
24 was said today, that the sponsor has done an  
25 outstanding job not only following up for 12 months

1 but actually going out to 24 months, and taking  
2 into consideration some of the concerns which have  
3 just been brought up about the grafts and things  
4 that occur after they are implanted. So, I think  
5 also that what Dr. Pina said relative to people  
6 being ambulatory, spending time in the ICU and just  
7 better healthcare for the patient overall, I  
8 believe this device will be able to provide that  
9 for patients.

10 DR. LASKEY: Thank you. Our appreciation  
11 again to Gore and their representatives, thank you  
12 very much, gentlemen, and to the FDA support staff.

13 DR. HARVEY: I would just like to make a  
14 point of clarification. The talk that was  
15 scheduled by FDA's Office of Surveillance and  
16 Biometrics at 4:30 has been moved to tomorrow's  
17 agenda.

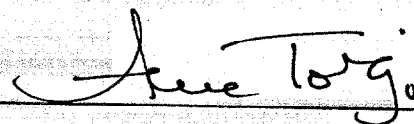

18 DR. LASKEY: We are adjourned.

19 [Whereupon, at 6:25 p.m., the proceedings  
20 were recessed, to resume at 8:00 a.m., Tuesday,  
21 September 10, 2002.]
